

# REALFLIGHT<sup>®</sup>

## R/C FLIGHT SIMULATOR

# G3.5<sup>™</sup>

**Pushing the physics envelope...**  
**at both ends of the skill spectrum!**

RealPhysics technology remains without equal for duplicating the physical laws and limitations of a flight at the field. It's unbelievably realistic...and you'll find it only in RealFlight.

Enhanced and expanded for RealFlight G3.5, RealPhysics now offers two new features — adding more real-life performance at both ends of the skill spectrum!

### 4D Physics Capability

Holding an airplane nose-down in a motionless hover just inches from the ground takes a variable-pitch prop system and a skilled, steady hand. Doing it on your computer takes RealFlight G3.5.

The Extra 300 includes a V-Pitch prop system. You can add one to the other small 3D electrics using G3.5's AccuModel™ aircraft editor.

How does it fly? Award-winning competition pilot John Glezellis was among those who carefully evaluated the performance — and gave it two highly experienced “thumbs up”.

### Counter-Rotating Heli Blades

For novice heli fliers, counter-rotating main blades have big advantages. When they rotate at the same speed, each cancels out the other's torque — improving stability with zero tendency to spin. Successful turns and hovers become a snap.

G3.5 captures the physics behind counter-rotating blades and brings it to the simulated Heli-Max™ Axe EZ. Now you can master heli control from your very first flight!

In RealFlight G3.5, only appearances are simulated...the physics are real, making RealPhysics 3D one of the most accurate models of flight in the world.
